Data Types

A C++ identifier is a name used to identify a variable, function, class, module, or any other user-defined item.

An identifier starts with a letter A to Z or a to z or an underscore (`_`) followed by zero or more letters, underscores, and digits (0 to 9).

C++ does not allow punctuation characters such as `,` `$`, and `%` within identifiers. C++ is a case-sensitive programming language. Thus, `Manpower` and `manpower` are two different identifiers in C++.

Reserved Words

C++ has a whole table of reserved words (also known as keywords). Since they are used by the language, these keywords are not available for re-definition or overloading.

The following list contains some of the reserved words you might come across:

- and
- auto
- bool
- break
- case
- catch
- char
- class
- const
- continue
- default
- delete
- do

C++ has several built-in as well as user defined data types to choose from.

some of the basic C++ data types are:

Type	Keyword	Range
Boolean	bool	true, false
Character	char	-128 to 127 or 0 to 255
Integer	int	-2,147,483,648 to 2,147,483,647
Floating point	float	
Double floating point	double	
Valueless	void

Check this out

~28 BITS OF ENTROPY

$2^{28} = 3 \text{ DAYS AT } 1000 \text{ GUESSES/SEC}$

(PLAUSIBLE ATTACK ON A WEAK REMOTE WEB SERVICE. YES, CRACKING A STOLEN HASH IS FASTER, BUT IT'S NOT WHAT THE AVERAGE USER SHOULD WORRY ABOUT.)

DIFFICULTY TO GUESS: **EASY**

WAS IT TROMBONE? NO, TROUBADOR. AND ONE OF THE 0s WAS A ZERO?

AND THERE WAS SOME SYMBOL...

DIFFICULTY TO REMEMBER: **HARD**

~44 BITS OF ENTROPY

$2^{44} = 530 \text{ YEARS AT } 1000 \text{ GUESSES/SEC}$

DIFFICULTY TO GUESS: **HARD**

THAT'S A BATTERY STAPLE.

CORRECT!

DIFFICULTY TO REMEMBER: YOU'VE ALREADY MEMORIZED IT

THROUGH 20 YEARS OF EFFORT, WE'VE SUCCESSFULLY TRAINED EVERYONE TO USE PASSWORDS THAT ARE HARD FOR HUMANS TO REMEMBER, BUT EASY FOR COMPUTERS TO GUESS.
